ABOUT US

We are a family-owned business based in East Mayo. For farmers who want to control docks, the Green Submarine provides a natural, simple, biological solution which avoids the headaches, health risks and environmental damage associated with application of chemical herbicides. Dock beetles are native and natural predators of docks. They shred the dock leaves and keep them to an acceptable level in grassland.

We produce dock beetles at our facility and provide them to farmers as a natural solution for dock control.

Louis Ward

Advantages

Does the job

Dock beetles are natural predators of docks. They skeletonize dock leaves three times per year.

Saves money

Dock beetles hibernate for the winter and go back to work for you each spring. No spray will do that!

Saves Time

Frees up all the time wasted by spraying

Safe

- No risk to human health
- No risk to environment Ideal for multi-species swards
- Increases biodiversity
- Does not set back grass

FREQUENTLY ASKED QUESTIONS

How effective are beetles at controlling docks?

Independent trials show that beetles eat most of the dock leaves three times per year

Do I need to change how I farm?

Other than not spraying, NO

Do the beetles eat anything else?

Their preference is for docks but they will eat polygonaceae (sorrel, Japanese Knotweed, grape vines, rhubarb) You should not place them beside rhubarb.

How soon will I see results?

Beetles will start laying eggs immediately. After six weeks a full lifecycle will be complete. It usually takes 3 months to see results at field scale.

Do the beetles move far?

No, an individual beetle will move about 8 metres in a lifetime. They do not fly.
